

Hi Folks,

To all my fellow RT Ryder's

Found a little gadget which allows you to play your music, listen to your GPS app and more from your phone without having to plug in your phone and to leave it in your trunk.

It's a little Bluetooth device which plugs in to your iPod hookup in the trunk, allowing you to use your phone at the front.

Pairing the device is easy, just plug in the device and it starts flashing. Go to your phone settings and select Bluetooth and find the device and connect to it. That's it!

Now your paired and can use your phone and stream music and more through your bikes stereo.

Your bikes stereo has to be in the AUX mode to work.

You also can use this device at any docking station for Apple products with a 30 pin connector to stream music via Bluetooth.

This device will work with any Apple product with a 30 pin connection.

Bluetooth function will allow to use any kind of phone with Bluetooth capability.(iPhone or Android)
